

ESP32 Arduino IDE Software Load V1

Both Nano & ESP 32 use the same computer program, Arduino IDE.

Please refer to the document Arduino IDE Software Load document' which describes where to find, install and use this software.

Note:- For ESP32, Only the Serial Monitor function of the software will work, which is all that is required for the Shutter Tester project. It is not possible to compile or load code or 'sketch' onto the ESP32 without additional setup, which is outside the scope of this document.

Note:- The Shutter Tester code can only be loaded using a flashing tool, as described in the firmware loading document. This is due to the complexities of the code, which now use multiple libraries, coding blocks & additional coding techniques, incompatible with loading via Arduino IDE.

Baud rate for ESP32 is 460800
